

Moving Walk Trolley Deflectors

Safety and Asset Protection for Moving Walks

Trolley deflectors are the most effective way to eliminate the direct contact from trolleys in the lower portion of the skirt panel and end plates. They can prevent injury and damage helping to minimize moving walk accidents and repair costs.

Safety

Trolley Deflectors can reduce the risk of injury which may be caused by trolleys and prams colliding with moving handrails, glass and skirting.

Ensuring a free flowing Moving Walkway is vital in making sure passenger traffic is not overcrowded near the entry and end points which may lead to passenger pile ups and injuries.

Requirements

Moving Walks are fundamental in ensuring smooth and efficient passenger flow through retail and transportation facilities.

Many passengers in these environments may be using shopping trolleys, strollers and/or luggage trolleys which can be difficult to maneuver when approaching the moving walk entry.

The trolley deflectors will ensure the wheels of the trolleys keep the trolley in the correct range to avoid impact damage.

Benefits

Trolley deflectors provide greater protection to the end plates and skirt entrances to Moving Walks.

They provide protection from trolley and pram impact that can lead to skirting, glass and handrail damage.

Trolley deflectors can reduce costly repair costs associated with damage rectification works.
